GUIDE
2024

SCOTTISH
UNIVERSITY
OF THE YEAR

Contents

- A brief history of wind power forecasting
- Challenges, advances, and opportunities
- The future of energy forecasting

Thanks to my many collaborators!

Links and references at the end...

A brief history of wind power forecasting

1980s

- First wind farms followed by the first research on wind power forecasting
- Predictive control for wind turbines

1990s

- Small island systems have immediate need for forecasting
- Combination of weather forecasts and wind farm models pioneered in Denmark

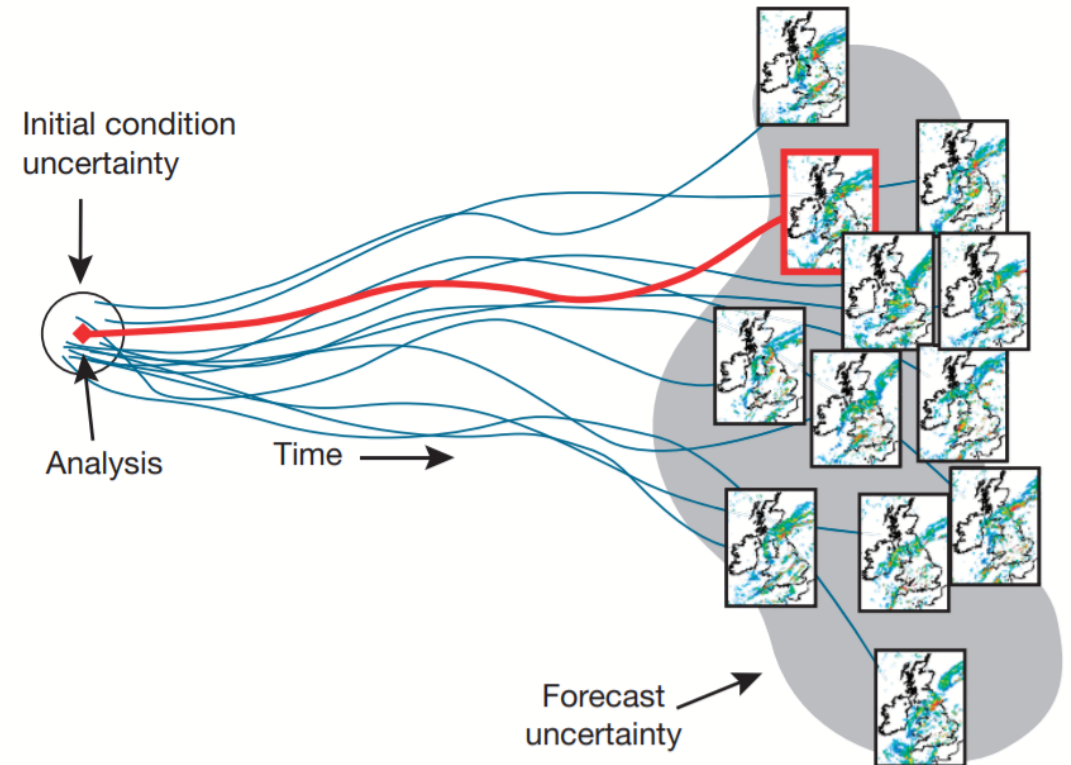

2000s

- Ensemble weather forecasting
- First wind and solar power forecasting start-ups

2010s

- R&D consolidation through ANEMOS.plus, WFIP, Smart4RES...
- Maturing and consolidation of commercial energy forecasting services

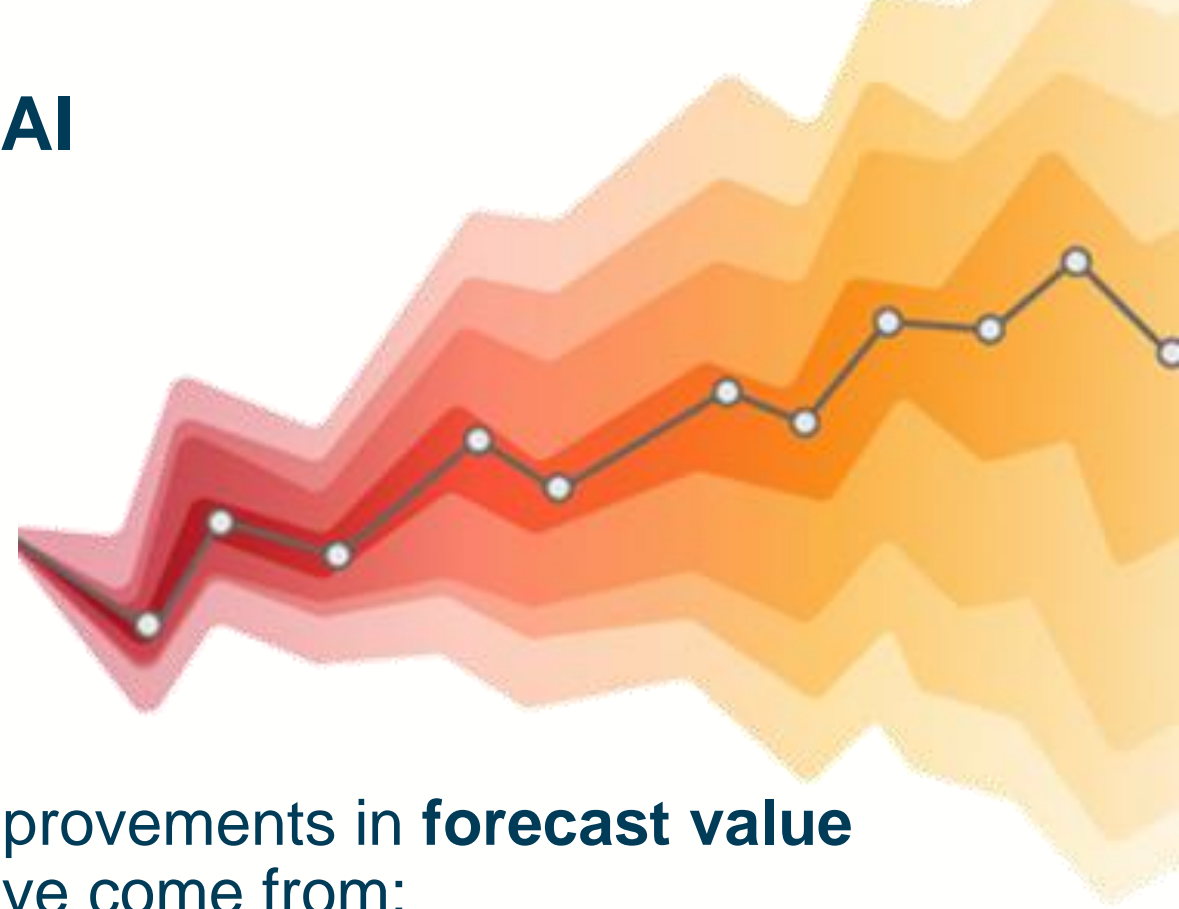

Challenges, advances, and opportunities

Machine Learning and AI

Improvements in **forecast skill** have come from:

1. New sources of predictability (and access to data)
2. ML, particularly tree methods and physics-informed implementation

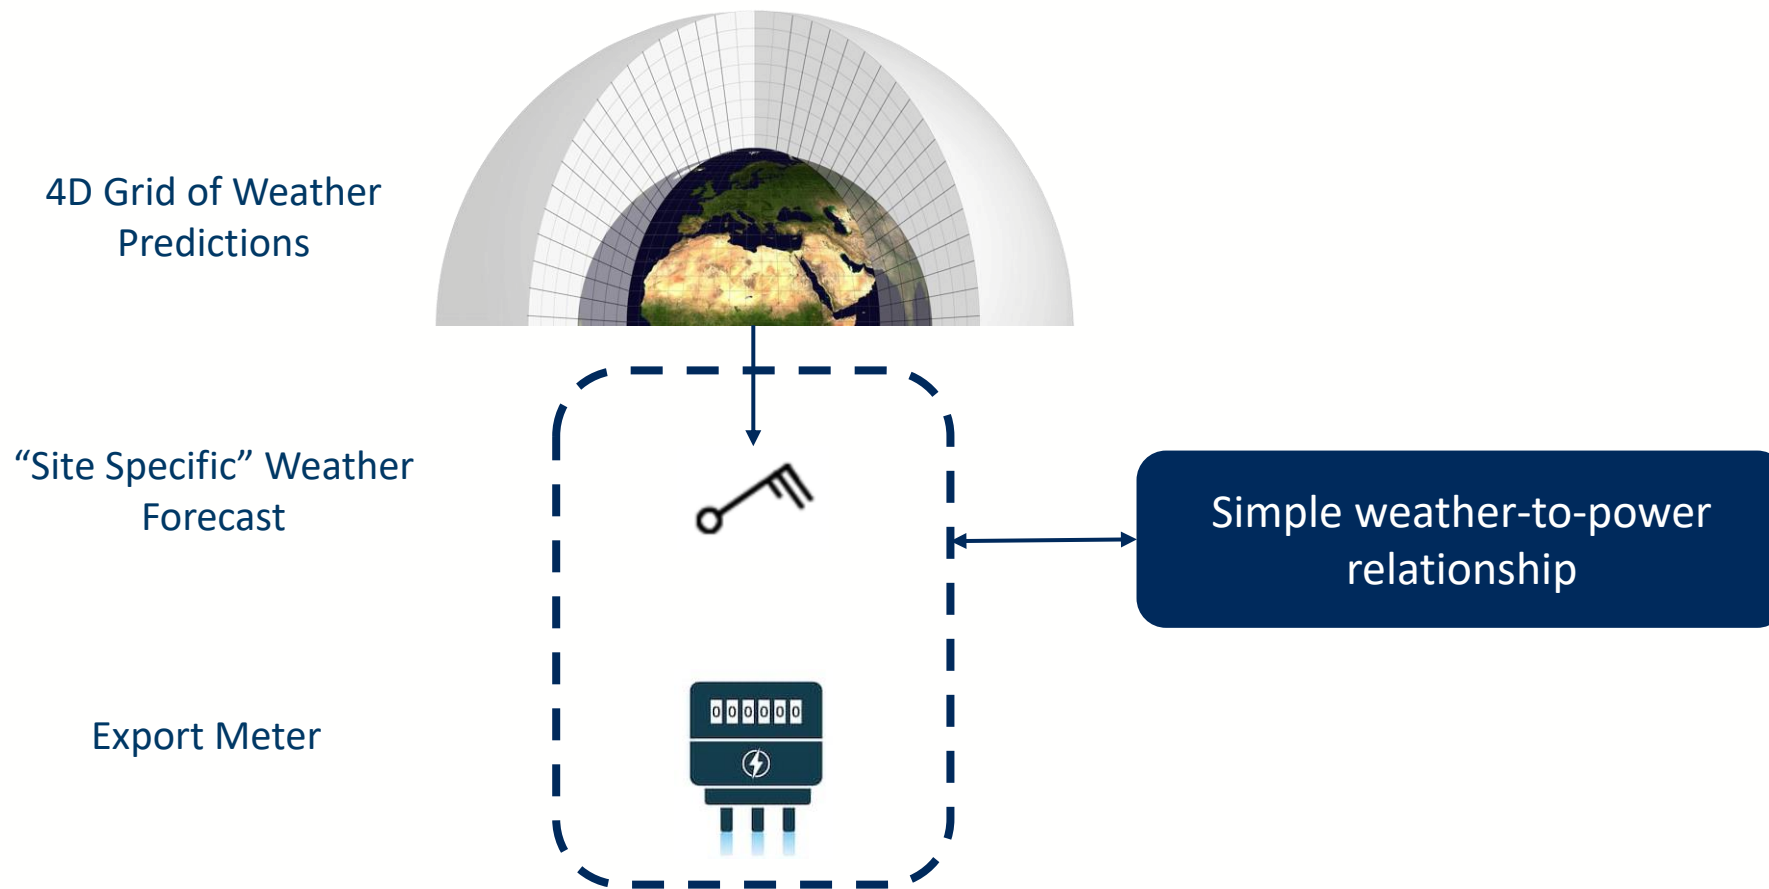

Improvements in **forecast value** have come from:

1. Making use of uncertainty quantification
2. Decision-support and automation
3. Closer collaboration between forecasters and forecast users

Improvements in forecast skill

(Wind or Solar)

Export Meter

Data-driven weather-to-
power relationship

University
of Glasgow

Improvement in forecast value

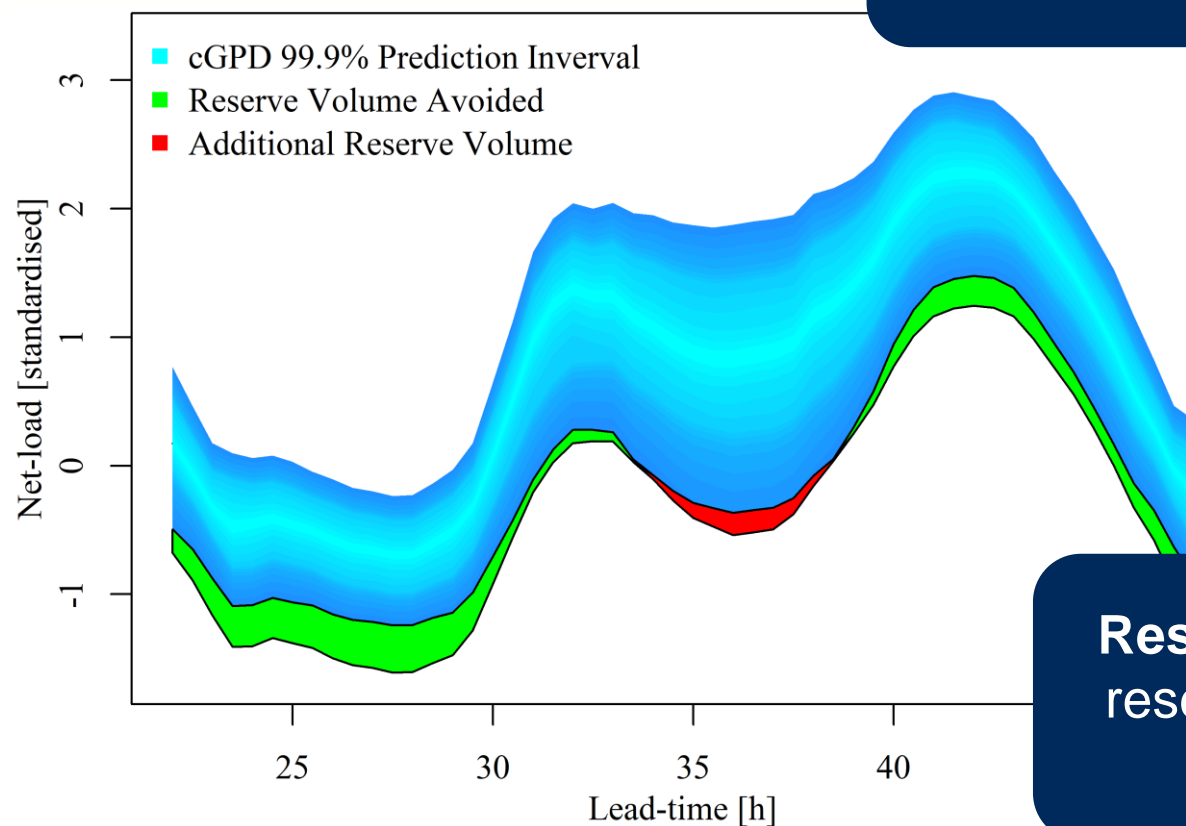

Example: Reserve procurement

With a reserve cost of £50/MWh, this represents a saving of approximately £75m per year!

Control REACT

NIA project with

nationalgridESO

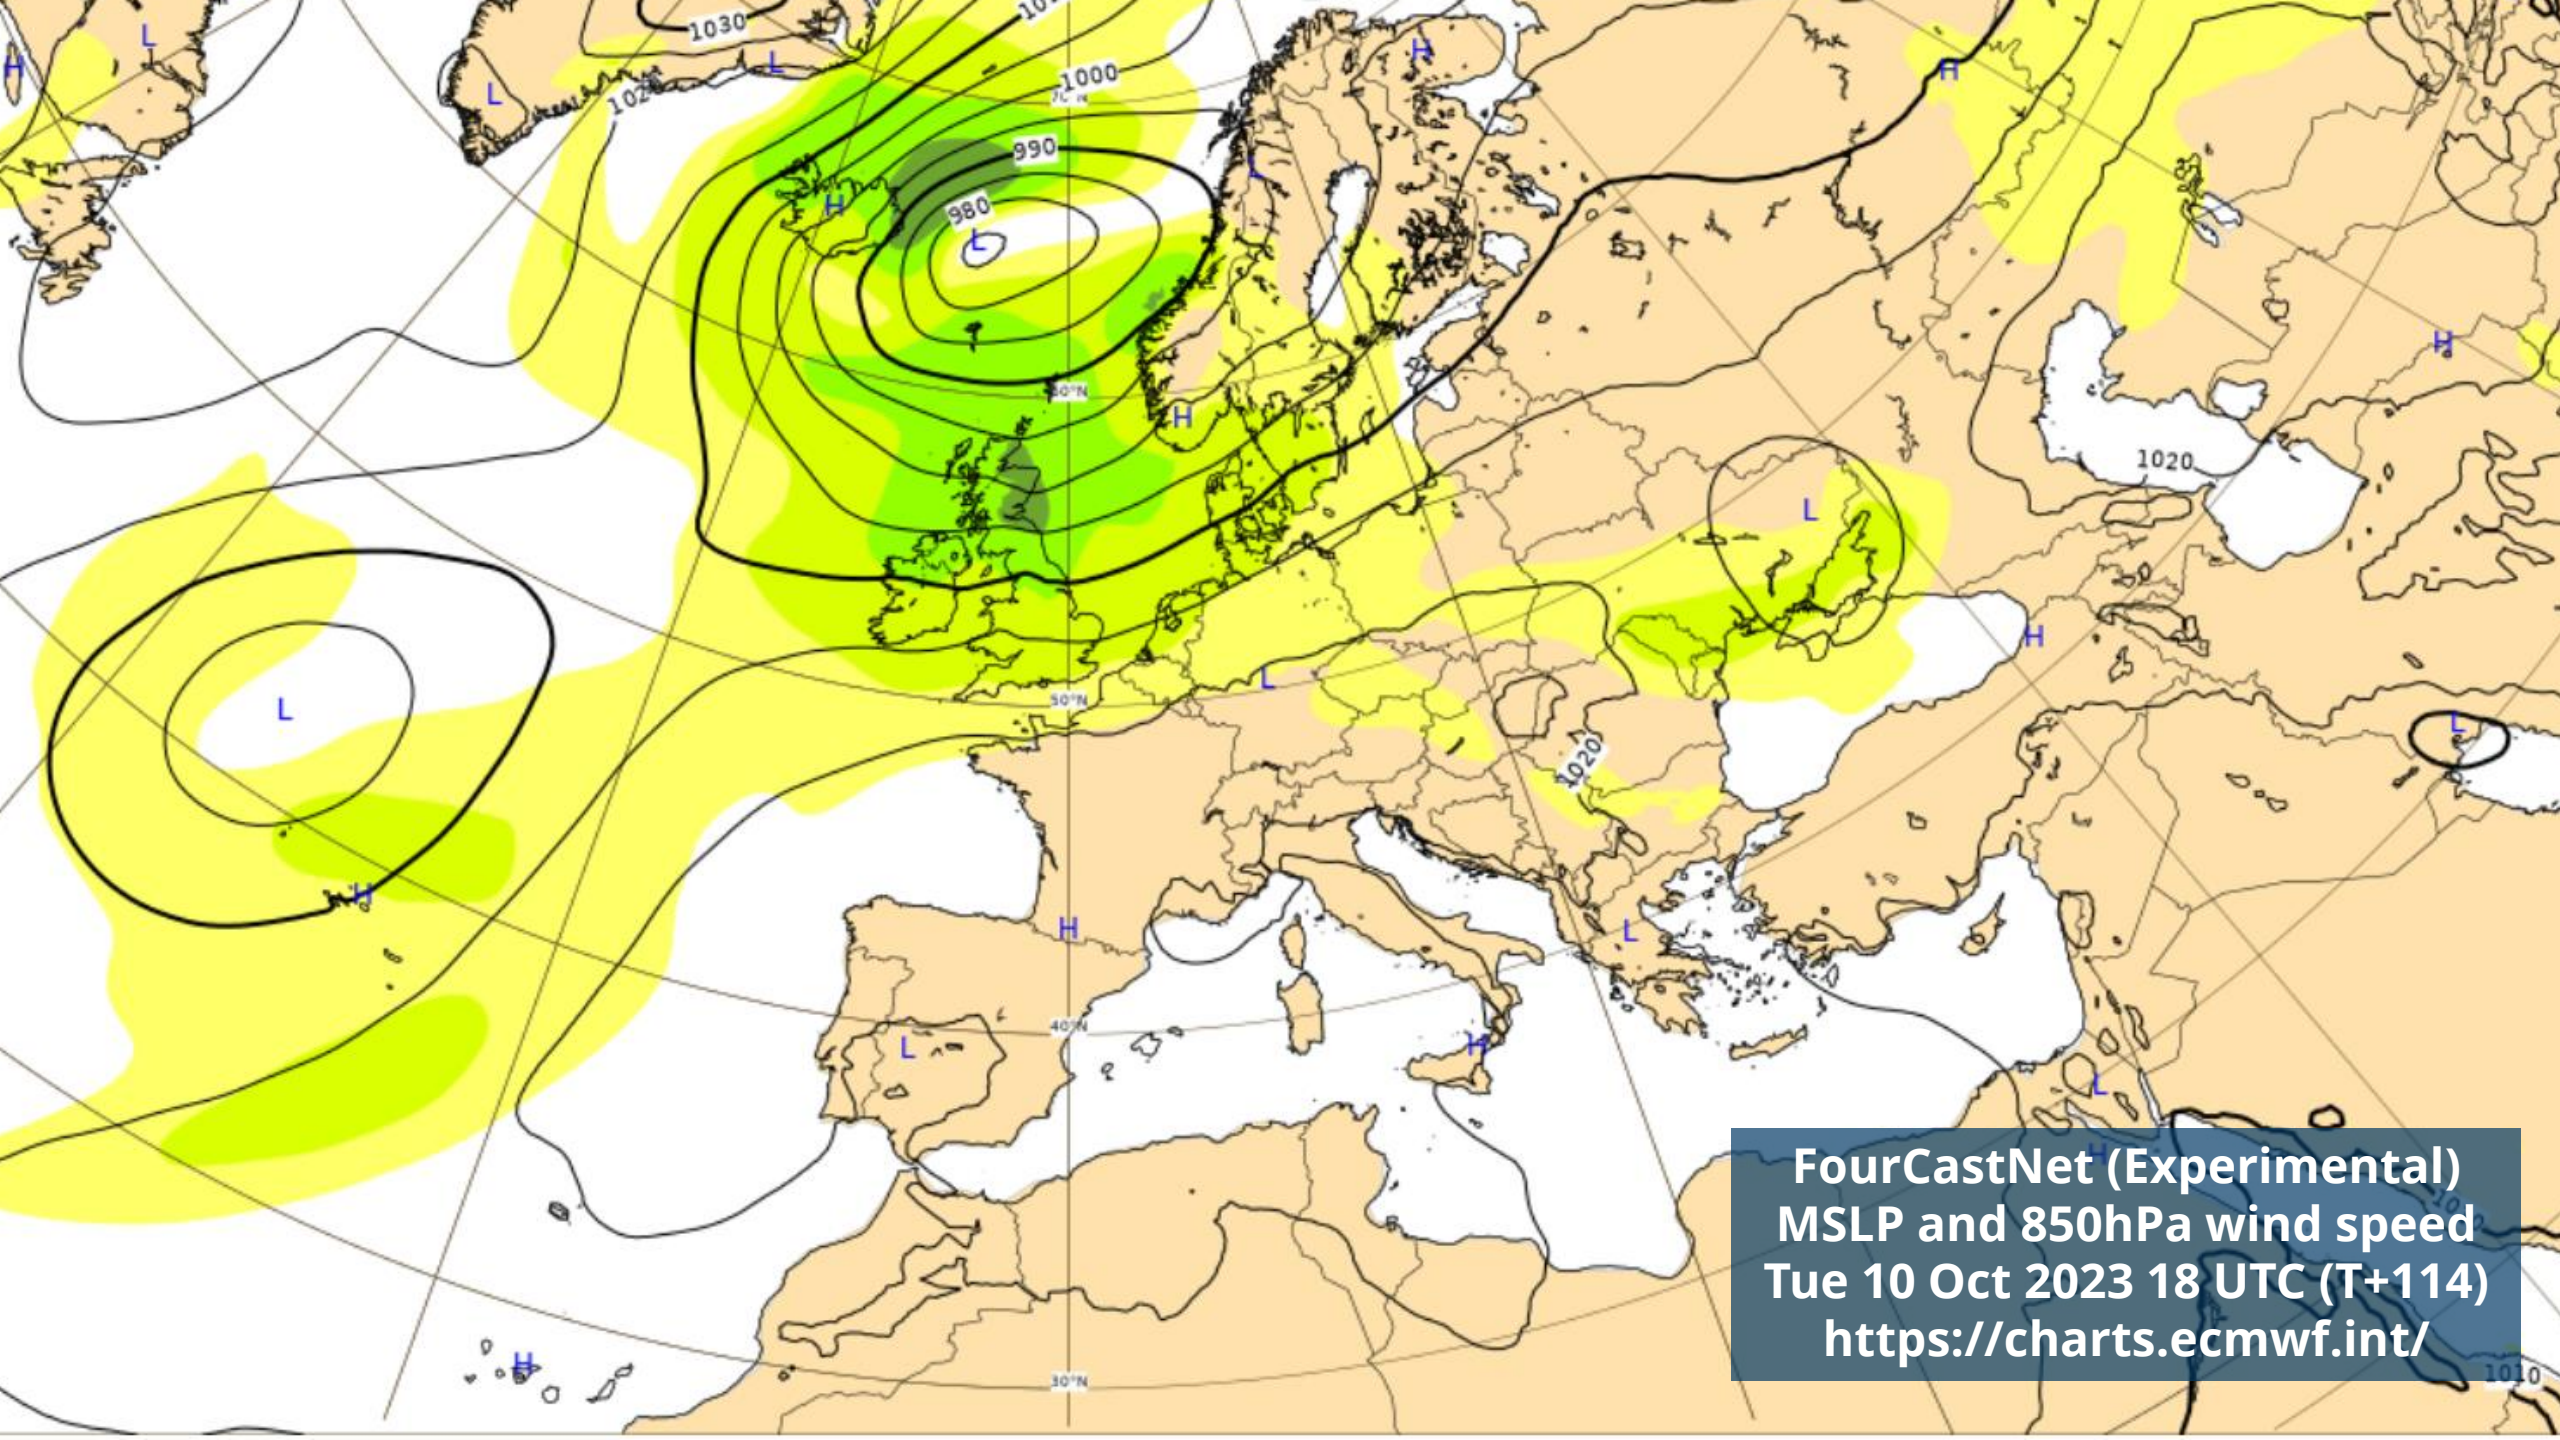

Sometimes (~25%) **more** reserve than benchmark needed to satisfy risk appetite

Most of the time, **less** reserve can be held than the benchmark

Result: overall reduction in reserve cost and improved risk profile

The future of energy forecasting

FourCastNet (Experimental)
MSLP and 850hPa wind speed

Machine Learning and AI

Data-driven weather forecasts

- Huawei, NVIDIA, DeepMind
- Super-fast!
- Competitive performance

Huawei's Pangu-Weather
performing very well!

Figure 1 from Ben-Bouallegxue *et al*
"The rise of data-driven weather
forecasting", 2023, arXiv:2307.10128

Forecast skill (the larger the better) over the Northern Hemisphere at day+2 and day+6. Skill is measured as the correlation between the forecasts and the verifying analysis (operational IFS) for the geopotential height at 500hPa.

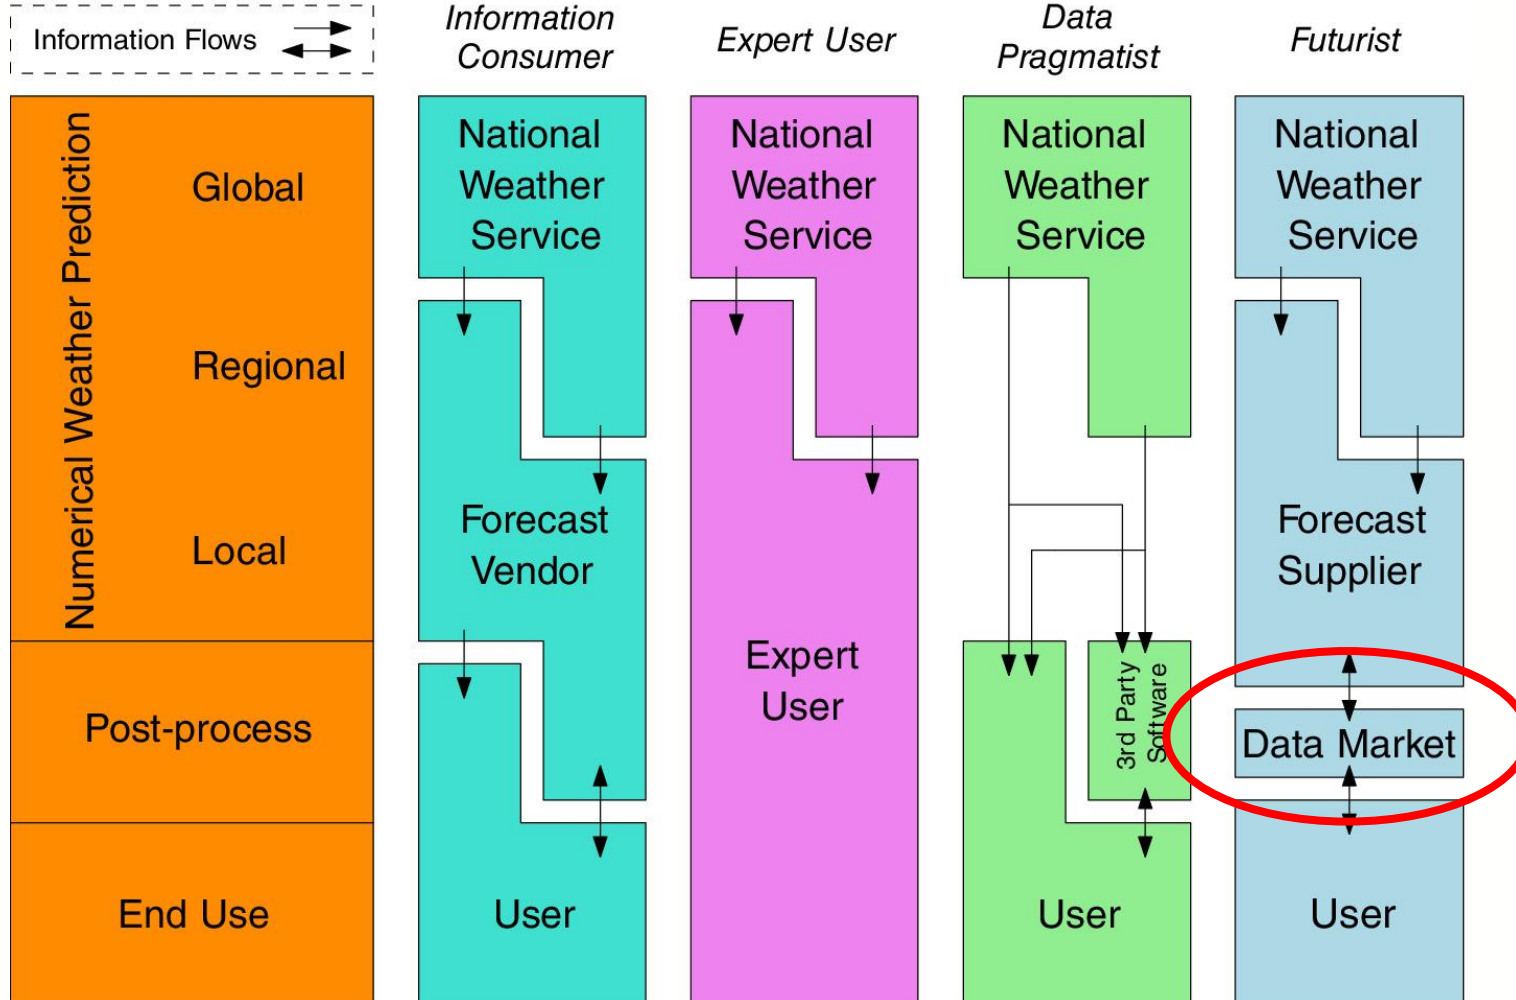

What do we want to predict anyway?

- **Energy:** Blocks of energy for trading and generator scheduling, risk/reserve requirements
- **Power:** ramps for balancing; instantaneous power for ancillary services, reactive power
- **Interdependency with markets:** risk management, algorithmic trading, embedded flexibility
- **Network flows/constraints:** probability of constraint, regional balancing, TSO/DSO flow

The future of energy forecasting?

- Sharing observations, forecasts, and models
- Incentivised through performance gain and financial remuneration
- Privacy-preserving to protect commercial interests and personal data
